CS 350 Algorithms and Complexity

Winter 2014

Lecture 1: Introduction

Andrew P. Black

based on material by Mark P. Jones

Department of Computer Science
Portland State University

Monday, 6 January 2014

Happy Birthday!

Happy Birthday!

✧ Are there two people in this room with the same birthday?

Monday, 6 January 2014

Surprisingly likely ...

Happy Birthday!

Happy Birthday!

- Are there two people in this room with the same birthday?
  - if so: what is that day?

Happy Birthday!

- Are there two people in this room with the same birthday?
  - if so: what is that day?
- How might we go about answering this question?

One Possible Algorithm:

	January							February							March							April

One Possible Algorithm:

Algorithm:

for each person in the room:
   find each's birthday on
            calendar
    if calendar day is marked
    then return that day
     else mark day on calendar
return false

Another Possible Algorithm

6

Another Possible Algorithm

Another Possible Algorithm

✧ Algorithm

for each person in the room:
    write each's birthday on the whiteboard
    for other people in the room:
        if other's birthday is on the whiteboard
           then return birthday
return false

Question:

✧ Which of these algorithms is better?

  ▪ You decide what "better" means

✧ A: Calendar Algorithm

✧ B: Whiteboard algorithm

Question:

✧ True or False: there are no other algorithms for this problem

✧ A: True
✧ B: False

Happy Birthday!

Happy Birthday!

- Are there two people in this room with the same birthday?

Happy Birthday!

- Are there two people in this room with the same birthday?

- How might we go about answering this question?

7

Happy Birthday!

- Are there two people in this room with the same birthday?
- How might we go about answering this question?
- How much effort would it take?
  - In the best case?
  - In the worst case?

Happy Birthday!

- Are there two people in this room with the same birthday?
- How might we go about answering this question?
- How much effort would it take?
  - In the best case?
  - In the worst case?
- Are there faster methods?

Happy Birthday!

- ✧ Are there two people in this room with the same birthday?
- ✧ How might we go about answering this question?
- ✧ How much effort would it take?
  - ▪ In the best case?
  - ▪ In the worst case?
- ✧ Are there faster methods?
- ✧ Are there approximate methods?

Fermat's Last Theorem:

Fermat's Last Theorem:

✧ Find integers, $a>0$, $b>0$, $c>0$, $n>2$, such that:

$$a^n + b^n = c^n$$

Fermat's Last Theorem:

✧ Find integers, $a > 0$, $b > 0$, $c > 0$, $n > 2$, such that:

$$a^n + b^n = c^n$$

if they exist.

✧ Could you write a program to "answer" this question?

- ▪ A: Yes
- ▪ B: No

8

Fermat's Last Theorem:

✧ Could you write an algorithm to "answer" this question?

- ■ A: Yes
- ■ B: No

Why Study Algorithms?

Why Study Algorithms?

✧ Because it's a required class!

"Most students attend college ...

- ✧ ... "because they are on a journey to independent adulthood"
- ✧ Translation: you want (amongst other things)
  - ■ a job, or career, or way to support yourselves while doing what you love
- ✧ How can studying algorithms help you?

Studying Algorithms can help you:

Studying Algorithms can help you:

✧ To recognize common patterns, or problem-solving strategies …

Studying Algorithms can help you:

✧ To recognize common patterns, or problem-solving strategies …

Studying Algorithms can help you:

✧ To recognize common patterns, or problem-solving strategies ...

✧ To be able to analyze algorithms for time- and space-efficiency

✧ To strengthen your mathematical, programming, and problem-solving skills ...

Studying Algorithms can help you:

Studying Algorithms can help you:

✧ To build a "repertoire" of algorithmic building blocks

Studying Algorithms can help you:

✧ To build a "repertoire" of algorithmic building blocks

Studying Algorithms can help you:

✧ To build a "repertoire" of algorithmic building blocks

✧ Because there is no better optimization than replacing a bad algorithm with a good one!

✧ Because it's fun and enlightening!

Piazza page:

- http://piazza.com/pdx/winter2014/cs350/home

Teaching Assistant / Grader

- ✧ We have a Teaching Assistant: Dona Hertel
  - ▪ Dona will hold recitation sections:
    - ◆ Monday 14:00–15:00
    - ◆ Wednesday 10:30–11:30.

- ✧ CS Tutors can help
- ✧ I can help too!
  - ▪ My office hours
    - ◆ Monday 11:30–noon
    - ◆ Wednesday 15:30–16:30

16

Piazza:

- Sign up at http://piazza.com/pdx/winter2014/cs350

- Required reading!

- The instructor, TA, and all students will see and can respond to questions posted on Piazza
  - Except for private questions to the instructor

- Interaction on Piazza counts for a small part of your grade.

Time and Location:

✧ Classes scheduled:

  - CIN 90 (but looking for a better room), 10:00-11:50 on Tuesdays and Thursdays

  - I'll notify you as soon as possible — on Piazza — if schedule changes are required

Assessment:

20% on homeworks (Some, but not all, will be formally graded; I'll be very clear about this when assignments are given out.)

20% on midterm (Provisionally, 6th Feb)

30% on Final (Tuesday 18th March, 10:15–12:05)

20%: Term paper/project: empirical analysis of algorithm behavior; further details after midterm

10%: Participation, in class & electronically.

Required Text:

- ✧ Introduction to the Design and Analysis of Algorithms (3rd Edition) by Anany Levitin. Addison Wesley).
- ✧ Very readable book: it's a MOC
Required Reading

- I'm not requiring you to just *own* Levitin, I'm requiring you to *read* it too!

- After today, I won't be lecturing on the material in the book

- Instead, class sessions will be used as an opportunity to interact with the material and to challenge your understanding.

Useful Reference Text:

- Introduction to Algorithms, 2nd or 3rd Ed
  Thomas H. Cormen, Charles E. Leiserson,
  Ronald L. Rivest, and Clifford Stein
  - Published by McGraw-Hill / MIT Press
  - A first edition was published in 1990. Much of the material appears in all editions, but the sections numbers are sometimes different!
  - Frequently called "CLRS"

- http://mitpress.mit.edu/algorithms/
Catalog Description:

✧ Techniques for the design and analysis of algorithms

✧ Case studies of existing algorithms:

- sorting
- searching
- graph algorithms
- dynamic programming
- matrix multiplication
- fast Fourier transformation

✧ NP-completeness

Course Goals

Upon Successful completion of this course, students will be able to:

1. Analyze the running time and space complexity of algorithms.

2. Use the big Oh notation. (e.g., $O(n \lg n)$.)

3. Describe how to prove the correctness of an algorithm.

4. Use the mathematical techniques required to prove the time complexity of a program/algorithm. (e.g., limits and sums of series.)

5. Perform inductive proofs.

6. Prove and apply the Master Theorem.

7. Describe the notions of P, NP, NPC, and NP-hard.

8. Compare the rates of growth of functions.

9. Apply algorithmic complexity principles in the design of programs.

10. Design divide and conquer and dynamic programming algorithms.

24

Provisional Plan:

Weeks	Topics	Levitin
2	Introduction to Algorithm Analysis, asymptotic notation, recurrence relations	§1–2
3	Brute force, Divide & Conquer, Master Theorem, Decrease & Conquer, Transform & Conquer	§3–6.4
2	Space & Time tradeoffs. Dynamic programming, Greedy algorithms	§7–9.4
1	Introduction to complexity theory, P, NP, NPC, etc. Proof of Correctness	§11.1–11.3

I'll be flexible!

✧ This schedule is intended as a rough guide only.

✧ Based on class interaction, we'll go slower (or faster) as necessary

  ▪ Your feedback will help to determine the pace!

✧ Suggestions/requests for other topics are always welcome

Policies:

✧ By default, all deadlines are firm. There will be penalties for unexcused late assignments.

✧ We will be as flexible as possible in accommodating special circumstances (talk to me in advance if you have a chance)

✧ We follow the standard policies for academic integrity:

  ▪ Discussion is good;

  ▪ Items turned in should be your own, individual work;

  ▪ Cheating is not acceptable.

✧ I put material on the website or Piazza rather than handing out paper.

Prerequisites:

- CS 250, CS251, CS311:
  - A solid grounding in discrete math

- This isn't a course about programming, but some programming experience is required

Programming Languages:

✧ Our primary goal is to learn about <u>general</u> concepts.

✧ A lot of the programs in this class will be given using "pseudo-code"

✧ For concrete examples, I might use Java, C, Smalltalk, Grace, or Pascal.

Monday, 6 January 2014

What Questions do you have?

Don't be shy …

… don't be afraid to ask questions!

(… don't be afraid to offer suggestions too!)

Algorithms: Introduction

Goals for this lecture:

✧ To understand the structure, content, and expectations of the course

✧ To explore the concept of an "algorithm", and the relationship with programs

✧ To appreciate how algorithms can be designed and analyzed

The origins of "Algorithm":

Al-Khawarizmi (~790-850)

✧ Iranian mathematician, geographer, astronomer.

✧ Credited with inventing zero (!), negative numbers, the decimal system, etc …

✧ Famous treatise: `Hisab al-jabr w'al-muqabala', from which we get the word `**algebra**'.
What is an "Algorithm"?

What is an "Algorithm"?

A <u>precise</u> set of rules specifying how to solve a particular problem.

What is an "Algorithm"?

A <u>precise</u> set of rules specifying how to solve a particular problem.

Expressed at a level of abstraction that allows:

✧ A focus on essential aspects only;

✧ Machine and language independence;

What is an "Algorithm"?

A <u>precise</u> set of rules specifying how to solve a particular problem.

Expressed at a level of abstraction that allows:

✧ A focus on essential aspects only;

✧ Machine and language independence;

✧ Rigorous scientific/mathematical analysis.

Example: Recipes in a Cookbook

✧ How to prepare your favorite dish.

✧ A recipe lists ingredients, measurements, equipment, timings, and the sequence of steps that need to be followed.

✧ In principle, any one, in any kitchen, can follow the recipe.

Example Recipe

1. Line a loose-bottomed quiche tin with pastry, and bake until done.
2. Sauté vegetables and season to taste
3. Allow vegetables to cool a little, and stir into previously-prepared egg mixture
4. Pour into the pastry case and bake until firm, but not brown.
   - 2 or 3 minutes before the quiche is done, sprinkle cheese on top and return to oven to brown.

What did you notice about the recipe?

1. Line a loose-bottomed quiche tin with pastry, and bake until done.
2. Sauté vegetables and season to taste
3. Allow vegetables to cool a little, and stir into previously-prepared egg mixture
4. Pour into the pastry case and bake until firm, but not brown.
   - 2 or 3 minutes before the quiche is done, sprinkle cheese on top and return to oven to brown.

37

What did you notice about the recipe?

✧ Is it an Algorithm?   (A: True, B: False)

1. Line a loose-bottomed quiche tin with pastry, and bake until done.
2. Sauté vegetables and season to taste
3. Allow vegetables to cool a little, and stir into previously-prepared egg mixture
4. Pour into the pastry case and bake until firm, but not brown.
   - 2 or 3 minutes before the quiche is done, sprinkle cheese on top and return to oven to brown.

37

What did you notice about the recipe?

- Is it an Algorithm?   (A: True, B: False)
- Features of a Program?

1. Line a loose-bottomed quiche tin with pastry, and bake until done.
2. Sauté vegetables and season to taste
3. Allow vegetables to cool a little, and stir into previously-prepared egg mixture
4. Pour into the pastry case and bake until firm, but not brown.
   - 2 or 3 minutes before the quiche is done, sprinkle cheese on top and return to oven to brown.

37

Example: Driving Directions

✧ Turn right out of the driveway, cross 39th Ave and turn right on 37th Ave.

✧ Proceed North to Gladstone.

✧ Turn left on Gladstone and continue down the hill to 26th Ave.

✧ Turn right on 26th, continue to Clinton.

✧ Left on Clinton; right on 21st; half-right onto Ladd Ave

✧ Continue straight across the roundabout

✧ Turn left on Clay, just before the light at 12th

✧ …

Example: Driving Directions

✧ Turn right out of the driveway, right again on 39th Ave

✧ Turn left on Holgate, and continue to McLoughlin Blvd.

✧ Exit onto Ross Island Bridge.

✧ After crossing bridge, turn right onto Corbett.

✧ Turn half-left onto Caruthers St.

✧ Turn Right onto 6th Ave

✧ Hot Lips Pizza will be on your left, on the corner with Hall Blvd.

✧ Park wherever you can.

Example: Driving Directions

✧ How to get from one place to another.

✧ A sequence of instructions indicating:

- Landmarks to look for;
- Junctions at which to turn;
- Distances to travel; etc

✧ Abstracts away from inessential details: when to apply brakes, how fast to travel, etc.

✧ Is mode of transportation an inessential detail?

Definition: Algorithm

✧ An Algorithm is a sequence of unambiguous instructions for solving a problem, i.e., for obtaining a required output for any legitimate input in a finite time.

problem

↓

algorithm

↓

input ⟶ | "computer" | ⟶ output
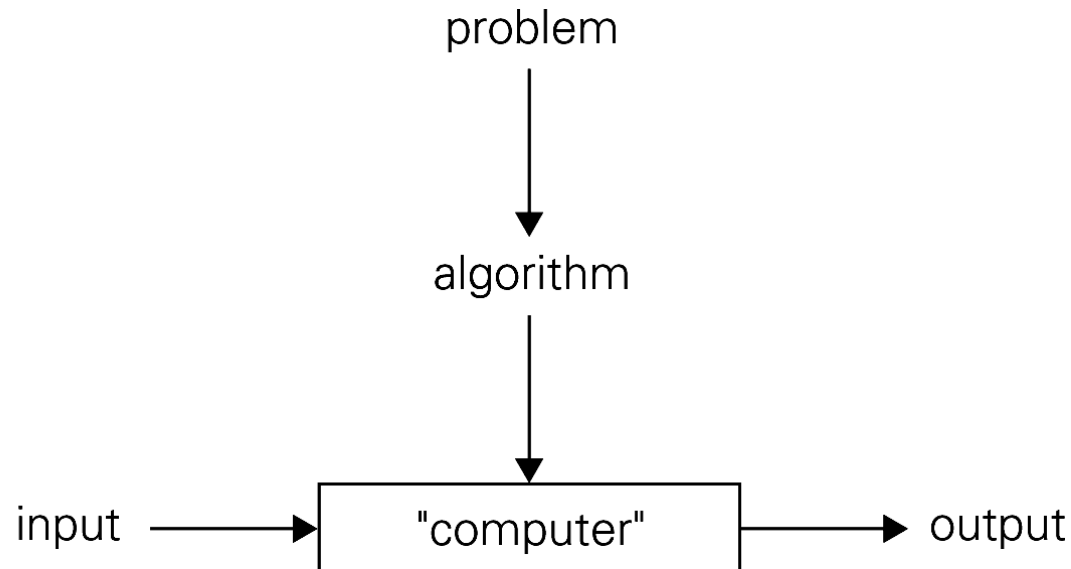

Properties of this Definition:

- ✧ each step must be unambiguous
- ✧ range of allowable inputs must be specified
- ✧ the same algorithm can be represented in different ways
- ✧ there can be several algorithms for the same problem
  - ▪ they can differ dramatically in concept, speed, and space requirements

Algorithms

- Which of the following are important characteristics of an algorithm?
    - A. Instructions are unambiguous
    - B. Instructions work for some inputs
    - C. The algorithm depends on the size of the input
    - D. Instructions work for all inputs
    - E. Algorithm always stops
    - F. Instructions are easy to understand

46

Example Algorithm: GCD

Example Algorithm: GCD

the GCD of two non-negative integers, not both zero, is the largest integer that divides both exactly.

Example Algorithm: GCD

the GCD of two non-negative integers, not both zero, is the largest integer that divides both exactly.

Note: careful description of legal inputs

Euclid's Algorithm for GCD

Based on repeated application of

GCD(m, n) = GCD(n, m mod n)

until (m mod n) = 0

ALGORITHM *Euclid(m, n)*

    //Computes gcd(m, n) by Euclid's algorithm
    //Input: Two nonnegative, not-both-zero integers m and n
    //Output: Greatest common divisor of m and n
    while $n \neq 0$ **do**
        $r \leftarrow m \bmod n$
        $m \leftarrow n$
        $n \leftarrow r$
    return m

ALGORITHM *Euclid*(m, n)

//Computes gcd(m, n) by Euclid's algorithm
//Input: Two nonnegative, not-both-zero integers m and n
//Output: Greatest common divisor of m and n
while $n \neq 0$ **do**
 $r \leftarrow m \bmod n$
 $m \leftarrow n$
 $n \leftarrow r$
return m

euclid: anIntegerParameter
  "Levitin §1"
  | m n r |
  m ← self.
  n ← anIntegerParameter.
  [n = 0] whileFalse: [
    r ← m mod: n.
    m ← n.
    n ← r].
  ↑ m

ALGORITHM $Euclid(m, n)$

//Computes $\gcd(m, n)$ by Euclid's algorithm

//Input: Two nonnegative, not-both-zero integers m and n

//Output: Greatest common divisor of m and n

while $n \neq 0$ **do**

  $r \leftarrow m \bmod n$

  $m \leftarrow n$

  $n \leftarrow r$

return m

Declare local variables

euclid: anIntegerParameter
    "Levitin §1"
    | m n r |

```

Another Algorithm for GCD

✧ Consecutive integer checking algorithm

1. $t \leftarrow \min(m, n)$

2. $r_1 \leftarrow m$ rem t.

3. if $r_1 = 0$ then goto step 4 else goto step 6

4. $r_2 \leftarrow n$ rem t.

5. if $r_2 = 0$ then return t

6. $t \leftarrow t - 1$

7. goto step 2

Compare these two algorithms

Euclid

while $n \neq 0$ **do**

$\quad r \leftarrow m \bmod n$

$\quad m \leftarrow n$

$\quad n \leftarrow r$

return m

Consecutive

1. $t \leftarrow \min(m, n)$
2. $r_1 \leftarrow m$ rem t.
3. if $r_1 = 0$ then goto step 4 else goto step 6
4. $r_2 \leftarrow n$ rem t.
5. if $r_2 = 0$ then return t
6. $t \leftarrow t - 1$
7. goto step 2

48

Compare these two algorithms

✧ Presentation style:
  - A: Euclid's is bad
  - B: Consecutive is bad
  - C: both are sort of OK
  - D: both are bad

Euclid

$$\textbf{while } n \neq 0 \textbf{ do}$$
$$r \leftarrow m \bmod n$$
$$m \leftarrow n$$
$$n \leftarrow r$$
$$\textbf{return } m$$

Consecutive
1. $t \leftarrow \min(m, n)$
2. $r_1 \leftarrow m$ rem t.
3. if $r_1 = 0$ then goto step 4 else goto step 6
4. $r_2 \leftarrow n$ rem t.
5. if $r_2 = 0$ then return t
6. $t \leftarrow t - 1$
7. goto step 2

48

Compare these two algorithms

Euclid

//Computes gcd(m, n) by Euclid's algorithm
//Input: Two nonnegative, not-both-zero integers m and n
//Output: Greatest common divisor of m and n
while $n \neq 0$ **do**
$\quad r \leftarrow m \bmod n$
$\quad m \leftarrow n$
$\quad n \leftarrow r$
return m

Consecutive

1. $t \leftarrow \min(m, n)$
2. $r_1 \leftarrow m$ rem t.
3. if $r_1 = 0$ then goto step 4 else goto step 6
4. $r_2 \leftarrow n$ rem t.
5. if $r_2 = 0$ then return t
6. $t \leftarrow t - 1$
7. goto step 2

Compare these two algorithms

✧ Valid inputs:
  - A: Euclid's specifies validity of inputs
  - B: Consecutive specifies validity of inputs
  - C: both specify validity of inputs
  - D: neither specifies validity of inputs

Euclid

//Computes gcd(m, n) by Euclid's algorithm
//Input: Two nonnegative, not-both-zero integers m and n
//Output: Greatest common divisor of m and n
while $n \neq 0$ **do**
    $r \leftarrow m \bmod n$
    $m \leftarrow n$
    $n \leftarrow r$
return m

Consecutive

1. $t \leftarrow \min(m, n)$
2. $r_1 \leftarrow m$ rem t.
3. if $r_1 = 0$ then goto step 4 else goto step 6
4. $r_2 \leftarrow n$ rem t.
5. if $r_2 = 0$ then return t
6. $t \leftarrow t - 1$
7. goto step 2

48

Compare these two algorithms

Euclid

$$\textbf{while } n \neq 0 \textbf{ do}$$
$$r \leftarrow m \bmod n$$
$$m \leftarrow n$$
$$n \leftarrow r$$
$$\textbf{return } m$$

Consecutive

1. $t \leftarrow \min(m, n)$
2. $r_1 \leftarrow m$ rem t.
3. if $r_1 = 0$ then goto step 4 else goto step 6
4. $r_2 \leftarrow n$ rem t.
5. if $r_2 = 0$ then return t
6. $t \leftarrow t - 1$
7. goto step 2

48

Compare these two algorithms

✧ Work required: in general
- A: Euclid's does more work
- B: Consecutive does more work
- C: both do the same amount of work

Euclid

while $n \neq 0$ **do**

$\quad r \leftarrow m \bmod n$

$\quad m \leftarrow n$

$\quad n \leftarrow r$

return m

Consecutive
1. $t \leftarrow \min(m, n)$
2. $r_1 \leftarrow m$ rem t.
3. if $r_1 = 0$ then goto step 4 else goto step 6
4. $r_2 \leftarrow n$ rem t.
5. if $r_2 = 0$ then return t
6. $t \leftarrow t - 1$
7. goto step 2

48

Compare these two algorithms

Euclid

while $n \neq 0$ **do**
  $r \leftarrow m \bmod n$
  $m \leftarrow n$
  $n \leftarrow r$
return m

Consecutive

1. $t \leftarrow \min(m, n)$
2. $r_1 \leftarrow m$ rem t.
3. if $r_1 = 0$ then goto step 4 else goto step 6
4. $r_2 \leftarrow n$ rem t.
5. if $r_2 = 0$ then return t
6. $t \leftarrow t - 1$
7. goto step 2

48

Compare these two algorithms

✧ Will they terminate on all valid inputs?

- A: Euclid's always terminates
- B: Consecutive always terminates
- C: both always terminate
- D: both may run forever

Euclid

```
while n ≠ 0 do
    r ← m mod n
    m ← n
    n ← r
return m
```

Consecutive

1. $t \leftarrow \min(m, n)$
2. $r_1 \leftarrow m$ rem t.
3. if $r_1 = 0$ then goto step 4 else goto step 6
4. $r_2 \leftarrow n$ rem t.
5. if $r_2 = 0$ then return t
6. $t \leftarrow t - 1$
7. goto step 2

Common Features:

Descriptions of algorithms often involve:

✧ Sequential and Parallel Execution;

✧ Conditionals and Decision Making;

✧ Looping and Repetition;

✧ Assumed Details (procedures);

✧ etc...

There are corresponding features in many programming languages.

How Good is an Algorithm?

Given a particular algorithm, we might ask:

- Does it solve the original problem?
- How fast is it?
- How much space does it require?
- Are there "better" ways to solve this problem?

First Approach: Experiment!

✧ Implement the algorithm;
✧ Run it on some test data.

But if we can't test all possible inputs:

✧ We might miss cases where the algorithm fails;
✧ We might miss cases where performance is particularly good (or bad);
✧ Results will depend on implementation details.

Works well in some, but not all cases.

Second Approach: Analyze!

✧ Study the algorithm in general terms;

✧ Try to predict general trends in behavior:

- ■ <u>Correctness</u>: Does it do the "right thing"?

- ■ <u>Performance</u>: How long does it take? How much memory does it use?

Correctness:

ALGORITHM *Euclid(m, n)*

//Computes gcd(m, n) by Euclid's algorithm

//Input: Two nonnegative, not-both-zero integers m and n

//Output: Greatest common divisor of m and n

while $n \neq 0$ **do**

    $r \leftarrow m \bmod n$

    $m \leftarrow n$

    $n \leftarrow r$

return m

Correctness:

For an informal proof of correctness of Euclid's algorithm, we begin with the equality:

ALGORITHM *Euclid*(m, n)

//Computes gcd(m, n) by Euclid's algorithm
//Input: Two nonnegative, not-both-zero integers m and n
//Output: Greatest common divisor of m and n
while $n \neq 0$ **do**
    $r \leftarrow m \bmod n$
    $m \leftarrow n$
    $n \leftarrow r$
return m

Correctness:

For an informal proof of correctness of Euclid's algorithm, we begin with the equality:

$$GCD(m, n) = GCD(n, m \bmod n)$$

ALGORITHM *Euclid(m, n)*
//Computes gcd(m, n) by Euclid's algorithm
//Input: Two nonnegative, not-both-zero integers m and n
//Output: Greatest common divisor of m and n
while $n \neq 0$ **do**
    $r \leftarrow m \bmod n$
    $m \leftarrow n$
    $n \leftarrow r$
return m

Correctness:

For an informal proof of correctness of Euclid's algorithm, we begin with the equality:

$$GCD(m, n) = GCD(n, m \bmod n)$$

Invariant: each time around the loop, GCD of the original two inputs = GCD(m, n)

ALGORITHM $Euclid(m, n)$
//Computes gcd(m, n) by Euclid's algorithm
//Input: Two nonnegative, not-both-zero integers m and n
//Output: Greatest common divisor of m and n
while $n \neq 0$ **do**
$\quad r \leftarrow m \bmod n$
$\quad m \leftarrow n$
$\quad n \leftarrow r$
return m

Correctness:

For an informal proof of correctness of Euclid's algorithm, we begin with the equality:

$$GCD(m, n) = GCD(n, m \bmod n)$$

Invariant: each time around the loop, GCD of the original two inputs = GCD(m, n)

Variant: each time around the loop, n gets smaller, but never becomes negative

ALGORITHM *Euclid(m, n)*
//Computes gcd(*m*, *n*) by Euclid's algorithm
//Input: Two nonnegative, not-both-zero integers *m* and *n*
//Output: Greatest common divisor of *m* and *n*
while $n \neq 0$ **do**
    $r \leftarrow m \bmod n$
    $m \leftarrow n$
    $n \leftarrow r$
return *m*

Correctness:

For an informal proof of correctness of Euclid's algorithm, we begin with the equality:

$$GCD(m, n) = GCD(n, m \bmod n)$$

Invariant: each time around the loop, GCD of the original two inputs = GCD(m, n)

Variant: each time around the loop, n gets smaller, but never becomes negative

Loop terminates when n = 0

ALGORITHM *Euclid(m, n)*
//Computes gcd(m, n) by Eucld's algorithm
//Input: Two nonnegative, not-both-zero integers m and n
//Output: Greatest common divisor of m and n
while $n \neq 0$ **do**
  $r \leftarrow m \bmod n$
  $m \leftarrow n$
  $n \leftarrow r$
return m

Correctness:

For an informal proof of correctness of Euclid's algorithm, we begin with the equality:

$$GCD(m, n) = GCD(n, m \bmod n)$$

Invariant: each time around the loop, GCD of the original two inputs = GCD(m, n)

Variant: each time around the loop, n gets smaller, but never becomes negative

Loop terminates when n = 0

GCD(m, 0) = m

ALGORITHM $Euclid(m, n)$
//Computes gcd(m, n) by Euclid's algorithm
//Input: Two nonnegative, not-both-zero integers m and n
//Output: Greatest common divisor of m and n
while $n \neq 0$ **do**
    $r \leftarrow m \bmod n$
    $m \leftarrow n$
    $n \leftarrow r$
return m

Performance:

Execution time depends on:
* the size of the input data;
* the input data itself;
* the machine and implementation.

What exactly do we want to measure?
* A: Clock ticks?
* B: Wall time?
* C: Number of machine instructions?
* D: Number of primitive operations?
* E: All of the above
* F: It doesn't really matter

- Suppose we have a program that calculates f(x) for some function f, and input x.

- We could write a program $f^{Time}(x)$ that calculates the time taken to execute f(x); this might be done by instrumenting the original code.

- In effect, we need to run the program for each given input, and measure how long it takes.

- In most cases, this is too much information to be useful!

55

- ✧ Solution: Abstract away from the specifics of particular input data.

- ✧ We can get useful information from a function

    $T(n)$ = time taken to process an input of "size" n

- ✧ It's up to us to decide what would be a good measure of "size";

- ✧ We can make do with approximations instead of precise timings.

Summary:

- The concept of an algorithm

- Dimensions of algorithm analysis

  - Correctness

  - Efficiency

- Approximating efficiency is OK
